

PYRIDO- AND PYRIMIDOPYRIMIDINE DERIVATIVES  
AS ANTI-PROLIFERATIVE AGENTS

This invention relates to pyrimidopyrimidine derived macrocycles that have  
5 been found to possess anti-proliferative activity, such as anti-cancer activity and are  
accordingly useful in methods of treatment of the human or animal body, for example  
in the manufacture of medicaments for use in hyper proliferative disorders such as  
atherosclerosis, restenosis and cancer. The invention also relates to processes for the  
manufacture of said pyrimidopyrimidine derivatives, to pharmaceutical compositions  
10 containing them and to their use in the manufacture of medicaments of use in the  
production of anti-proliferative effect .

In particular, the compounds of the present invention were found to inhibit  
tyrosine kinase enzymes, also called tyrosine kinases. Tyrosine kinases are a class of  
enzymes, which catalyse the transfer of the terminal phosphate of adenosine  
15 triphosphate to the phenolic hydroxyl group of a tyrosine residue present in the target  
protein. It is known, that several oncogenes, involved in the transformation of a cell  
into a malignant tumour cell, encode tyrosine kinase enzymes including certain growth  
factor receptors such as EGF, FGF, IGF-1R, IR, PDGF and VEGF. This family of  
receptor tyrosine kinases and in particular the EGF family of receptor tyrosine kinases  
20 are frequently present in common human cancers such as breast cancer, non-small cell  
lung cancers including adenocarcinomas and squamous cell cancer of the lung, bladder  
cancer, oesophageal cancer, gastrointestinal cancer such as colon, rectal or stomach  
cancer, cancer of the prostate, leukaemia and ovarian, bronchial or pancreatic cancer,  
which are examples of cell proliferation related disorders.

25

Accordingly, it has been recognised that the selective inhibition of tyrosine  
kinases will be of value in the treatment of cell proliferation related disorders. Support  
for this view is provided by the development of Herceptin® (Trastuzumab) and  
Gleevec™ (imatinib mesylate) the first examples of target based cancer drugs.  
30 Herceptin® (Trastuzumab) is targeted against Her2/*neu*, a receptor tyrosine kinase  
found to be amplified up to 100-fold in about 30% of patients with invasive breast  
cancer. In clinical trials Herceptin® (Trastuzumab) proved to have anti-tumour activity  
against breast cancer (Review by L.K. Shawer *et al*, "Smart Drugs: Tyrosine kinase  
inhibitors in cancer therapy", 2002, Cancer Cell Vol.1, 117), and accordingly provided  
35 the proof of principle for therapy targeted to receptor tyrosine kinases. The second  
example, Gleevec™ (imatinib mesylate), is targeted against the abelson tyrosine kinase

-2-

(Bcr-Abl), a constitutively active cytoplasmic tyrosine kinase present in virtually all patients with chronic myelogenous leukaemia (CML) and 15% to 30% of adult patients with acute lymphoblastic leukaemia. In clinical trials Gleevec™ (imatinib mesylate) showed a spectacular efficacy with minimal side effects that led to an approval within 3 months of submission. The speed of passage of this agent through clinical trials and regulatory review has become a case study in rapid drug development (Drucker B.J. & Lydon N., "Lessons learned from the development of an Abl tyrosine kinase inhibitor for chronic myelogenous leukaemia.", 2000, J.Clin.Invest. 105, 3).

Further support is given by the demonstration that EGF receptor tyrosine kinase inhibitors, specifically attenuates the growth in athymic nude mice of transplanted carcinomas such as human mammary carcinoma or human squamous cell carcinoma (Review by T.R. Burke Jr., Drugs of the Future, 1992, 17, 119). As a consequence, there has been considerable interest in the development of drugs to treat different cancers that target the EGFR receptor. For example, several antibodies that bind to the extra-cellular domain of EGFR are undergoing clinical trials, including Erbitux™ (also called C225, Cetuximab), which was developed by Imclone Systems and is in Phase III clinical trials for the treatment of several cancers. Also, several promising orally active drugs that are potent and relatively specific inhibitors of the EGFR tyrosine kinase are now well advanced in clinical trials. The AstraZeneca compound ZD1839, which is now called IRESSA® and approved for the treatment of advanced non-small-cell lung cancer, and the OSI/Genentech/Roche compound OSI-774, which is now called Tarceva™ (erlotinib), have shown marked efficacy against several cancers in human clinical trials (Morin M.J., "From oncogene to drug: development of small molecule tyrosine kinase inhibitors as anti-tumour and anti-angiogenic agents, 2000, Oncogene 19, 6574).

In addition to the above, EGF receptor tyrosine kinases has been shown to be implicated in non-malignant proliferative disorders such as psoriasis (elder *et al.*, Science, 1989, 243; 811). It is therefore expected that inhibitors of EGF type receptor tyrosine kinases will be useful in the treatment of non-malignant diseases of excessive cellular proliferation such as psoriasis, benign prostatic hypertrophy, atherosclerosis and restenosis.

It is disclosed in International Patent Applications WO 96/07657 & WO97/32880 that pyrimidopyrimidines are useful as inhibitors of tyrosine kinase and in particular of the EGF type receptor tyrosine kinases. Unexpectedly it was found that

-3-

pyrimidopyrimidine derivatives of the present formula (I) that are different in structure show to have tyrosine kinase inhibitory activity.

It is accordingly an object of the present invention to provide further tyrosine kinase inhibitors useful in the manufacture of medicaments in the treatment of cell proliferative related disorders.

In brief, for those compounds of formula (I) where –X<sup>1</sup>– represents –NH– said compounds are generally prepared by reacting the 4-chloro-6-fluoro-pyridopyrimidines or 4,6-dichloro-pyridopyrimidines of formula (II) with an appropriate aniline (III) using art known reaction conditions, such as for example using a base such as triethylamine, *N*-ethyl-*N*-(1-methylethyl)-2-propaneamine (DIPEA) and alike or an inorganic base such as Na<sub>2</sub>CO<sub>3</sub>, K<sub>2</sub>CO<sub>3</sub> and alike in a suitable polar solvent such as propane-2-ol, 1-butanol, acetonitrile and alike at elevated temperatures (60-90°C or reflux temperatures). The thus obtained anilinopyridopyrimidens (IV) are in a further step substituted by a suitable amine of formula (VII) to give the intermediate of formula VIII. It will be appreciated by those skilled in the art that in the processes described above the functional groups of intermediate compounds may need to be blocked by protecting groups.

- 5 Functional groups, which it is desirable to protect, include hydroxy, amino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl groups (e.g. tert-butyldimethylsilyl, tert-butyldiphenylsilyl or trimethylsilyl), benzyl and tetrahydropyranyl. Suitable protecting groups for amino include tert-butyloxycarbonyl or benzyloxycarbonyl. Suitable protecting groups for carboxylic acid include C<sub>(1-6)</sub>alkyl  
10 or benzyl esters.

The protection and deprotection of functional groups may take place before or after a reaction step.

- 15 Additionally, the N-atoms in compounds of formula (I) can be methylated by art-known methods using CH<sub>3</sub>-I in a suitable solvent such as, for example 2-propanone, tetrahydrofuran or dimethylformamide.

- The compounds of formula (I) can also be converted into each other following art-known procedures of functional group transformation of which some examples are  
20 mentioned hereinafter.

- The compounds of formula (I) may also be converted to the corresponding *N*-oxide forms following art-known procedures for converting a trivalent nitrogen into its  
25 *N*-oxide form. Said *N*-oxidation reaction may generally be carried out by reacting the starting material of formula (I) with 3-phenyl-2-(phenylsulfonyl)oxaziridine or with an appropriate organic or inorganic peroxide. Appropriate inorganic peroxides comprise, for example, hydrogen peroxide, alkali metal or earth alkaline metal peroxides, e.g. sodium peroxide, potassium peroxide; appropriate organic peroxides may comprise  
30 peroxy acids such as, for example, benzenecarboperoxoic acid or halo substituted benzenecarboperoxoic acid, e.g. 3-chlorobenzenecarboperoxoic acid, peroalkanoic acids, e.g. peroacetic acid, alkylhydroperoxides, e.g. *t*-butyl hydroperoxide. Suitable solvents are, for example, water, lower alkanols, e.g. ethanol and the like, hydrocarbons, e.g. toluene, ketones, e.g. 2-butanone, halogenated hydrocarbons, e.g.  
35 dichloromethane, and mixtures of such solvents.

-26-

Pure stereochemically isomeric forms of the compounds of formula (I) may be obtained by the application of art-known procedures. Diastereomers may be separated by physical methods such as selective crystallization and chromatographic techniques, e.g. counter-current distribution, liquid chromatography and the like.

5

Some of the compounds of formula (I) and some of the intermediates in the present invention may contain an asymmetric carbon atom. Pure stereochemically isomeric forms of said compounds and said intermediates can be obtained by the application of art-known procedures. For example, diastereoisomers can be separated by physical methods such as selective crystallization or chromatographic techniques, e.g. counter current distribution, liquid chromatography and the like methods. Enantiomers can be obtained from racemic mixtures by first converting said racemic mixtures with suitable resolving agents such as, for example, chiral acids, to mixtures of diastereomeric salts or compounds; then physically separating said mixtures of diastereomeric salts or compounds by, for example, selective crystallization or chromatographic techniques, e.g. liquid chromatography and the like methods; and finally converting said separated diastereomeric salts or compounds into the corresponding enantiomers. Pure stereochemically isomeric forms may also be obtained from the pure stereochemically isomeric forms of the appropriate intermediates and starting materials, provided that the intervening reactions occur stereospecifically.

20

An alternative manner of separating the enantiomeric forms of the compounds of formula (I) and intermediates involves liquid chromatography, in particular liquid chromatography using a chiral stationary phase.

25

Some of the intermediates and starting materials as used in the reaction procedures mentioned hereinabove are known compounds and may be commercially available or may be prepared according to art-known procedures. However, in the synthesis of the compounds of formula (I), the present invention further provides the intermediates of formula (III)

As described in the experimental part hereinafter, the growth inhibitory effect and anti-tumour activity of the present compounds and some of the intermediates has been

20 demonstrated in vitro, in enzymatic assays on the receptor tyrosine kinase EGFR. In an alternative assay, the growth inhibitory effect of the compounds was tested on the ovarian carcinoma cell line SKOV3 using art known cytotoxicity assays such as LIVE/DEAD (Molecular Probes) or MTT.

25 Accordingly, the present invention provides the compounds of formula (I) and the intermediates of formula (XXXI) and their pharmaceutically acceptable *N*-oxides, addition salts, quaternary amines and stereochemically isomeric forms for use in therapy. More particular in the treatment or prevention of cell proliferation mediated diseases. The compounds of formula (I), the intermediates of formula (XXXI) and their

30 pharmaceutically acceptable *N*-oxides, addition salts, quaternary amines and the stereochemically isomeric forms may hereinafter be referred to as compounds according to the invention.

Disorders for which the compounds according to the invention are particularly useful

35 are atherosclerosis, restenosis, cancer and diabetic complications e.g. retinopathy.

-31-

In view of the utility of the compounds according to the invention, there is provided a method of treating a cell proliferative disorder such as atherosclerosis, restenosis and cancer, the method comprising administering to an animal in need of such treatment, for example, a mammal including humans, suffering from a cell proliferative disorder,  
5 a therapeutically effective amount of a compound according to the present invention.

Said method comprising the systemic or topical administration of an effective amount of a compound according to the invention, to animals, including humans. One skilled in the art will recognize that a therapeutically effective amount of the EGFR inhibitors  
10 of the present invention is the amount sufficient to induce the growth inhibitory effect and that this amount varies *inter alia*, depending on the size, the type of the neoplasia, the concentration of the compound in the therapeutic formulation, and the condition of the patient. Generally, an amount of EGFR inhibitor to be administered as a therapeutic agent for treating cell proliferative disorder such as atherosclerosis,  
15 restenosis and cancer, will be determined on a case by case by an attending physician.

Generally, a suitable dose is one that results in a concentration of the EGFR inhibitor at the treatment site in the range of 0.5 nM to 200  $\mu$ M, and more usually 5 nM to 10  $\mu$ M. To obtain these treatment concentrations, a patient in need of treatment likely will be  
20 administered between 0.01 mg/kg to 300 mg/kg body weight, in particular from 10 mg/kg to 100 mg/kg body weight. As noted above, the above amounts may vary on a case-by-case basis. In these methods of treatment the compounds according to the invention are preferably formulated prior to admission. As described herein below, suitable pharmaceutical formulations are prepared by known procedures using well  
25 known and readily available ingredients.

Due to their high degree of selectivity as EGFR inhibitors, the compounds of formula (I) and the intermediates of formula (XXXI) as defined above, are also useful to mark or identify the kinase domain within the receptor tyrosine kinase receptors. To  
30 this purpose, the compounds of the present invention can be labelled, in particular by replacing, partially or completely, one or more atoms in the molecule by their radioactive isotopes. Examples of interesting labelled compounds are those compounds having at least one halo which is a radioactive isotope of iodine, bromine or fluorine; or those compounds having at least one  $^{11}\text{C}$ -atom or tritium atom.

35 One particular group consists of those compounds of formula (I) and intermediates of formula (XXXI) wherein  $\text{R}^1$  is a radioactive halogen atom. In principle, any compound according to the invention containing a halogen atom is prone for

-32-

radiolabelling by replacing the halogen atom by a suitable isotope. Suitable halogen radioisotopes to this purpose are radioactive iodides, e.g.  $^{122}\text{I}$ ,  $^{123}\text{I}$ ,  $^{125}\text{I}$ ,  $^{131}\text{I}$ ; radioactive bromides, e.g.  $^{75}\text{Br}$ ,  $^{76}\text{Br}$ ,  $^{77}\text{Br}$  and  $^{82}\text{Br}$ , and radioactive fluorides, e.g.  $^{18}\text{F}$ . The introduction of a radioactive halogen atom can be performed by a suitable exchange reaction or by using any one of the procedures as described hereinabove to prepare halogen derivatives of formula (I).

Another interesting form of radiolabelling is by substituting a carbon atom by a  $^{11}\text{C}$ -atom or the substitution of a hydrogen atom by a tritium atom.

Hence, said radiolabelled compounds according to the invention can be used in a process of specifically marking receptor sites in biological material. Said process comprises the steps of (a) radiolabelling a compound according to the invention, (b) administering this radiolabelled compound to biological material and subsequently (c) detecting the emissions from the radiolabelled compound.

The term biological material is meant to comprise every kind of material which has a biological origin. More in particular this term refers to tissue samples, plasma or body fluids but also to animals, specially warm-blooded animals, or parts of animals such as organs.

When used in *in vivo* assays, the radiolabelled compounds are administered in an appropriate composition to an animal and the location of said radiolabelled compounds is detected using imaging techniques, such as, for instance, Single Photon Emission Computerized Tomography (SPECT) or Positron Emission Tomography (PET) and the like. In this manner the distribution of the particular receptor sites throughout the body can be detected and organs containing said receptor sites can be visualized by the imaging techniques mentioned hereinabove. This process of imaging an organ by administering a radiolabelled compound of formula (I) and detecting the emissions from the radioactive compound also constitutes a part of the present invention.

In yet a further aspect, the present invention provides the use of the compounds according to the invention in the manufacture of a medicament for treating any of the aforementioned cell proliferative disorders or indications.

The amount of a compound according to the present invention, also referred to here as the active ingredient, which is required to achieve a therapeutical effect will be, of course, vary with the particular compound, the route of administration, the age and condition of the recipient, and the particular disorder or disease being treated. A suitable daily dose would be from 0.01 mg/kg to 300 mg/kg body weight, in particular from 10 mg/kg to 100 mg/kg body weight. A method of treatment may also include

-33-

administering the active ingredient on a regimen of between one and four intakes per day.

5 While it is possible for the active ingredient to be administered alone, it is preferable to present it as a pharmaceutical composition. Accordingly, the present invention further provides a pharmaceutical composition comprising a compound according to the present invention, together with a pharmaceutically acceptable carrier or diluent. The carrier or diluent must be "acceptable" in the sense of being compatible with the other ingredients of the composition and not deleterious to the recipients thereof.

10 The pharmaceutical compositions of this invention may be prepared by any methods well known in the art of pharmacy, for example, using methods such as those described in Gennaro et al. Remington's Pharmaceutical Sciences (18<sup>th</sup> ed., Mack Publishing Company, 1990, see especially Part 8 : Pharmaceutical preparations and their  
15 Manufacture). A therapeutically effective amount of the particular compound, in base form or addition salt form, as the active ingredient is combined in intimate admixture with a pharmaceutically acceptable carrier, which may take a wide variety of forms depending on the form of preparation desired for administration. These pharmaceutical compositions are desirably in unitary dosage form suitable, preferably, for systemic  
20 administration such as oral, percutaneous or parenteral administration; or topical administration such as via inhalation, a nose spray, eye drops or via a cream, gel, shampoo or the like. For example, in preparing the compositions in oral dosage form, any of the usual pharmaceutical media may be employed, such as, for example, water, glycols, oils, alcohols and the like in the case of oral liquid preparations such as  
25 suspensions, syrups, elixirs and solutions; or solid carriers such as starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like in the case of powders, pills, capsules and tablets. Because of their ease in administration, tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are obviously employed. For parenteral compositions, the carrier will  
30 usually comprise sterile water, at least in large part, though other ingredients, for example, to aid solubility, may be included. Injectable solutions, for example, may be prepared in which the carrier comprises saline solution, glucose solution or a mixture of saline and glucose solution. Injectable suspensions may also be prepared in which case appropriate liquid carriers, suspending agents and the like may be employed. In the  
35 compositions suitable for percutaneous administration, the carrier optionally comprises a penetration enhancing agent and/or a suitable wettable agent, optionally combined with suitable additives of any nature in minor proportions, which additives do not cause

-34-

any significant deleterious effects on the skin. Said additives may facilitate the administration to the skin and/or may be helpful for preparing the desired compositions. These compositions may be administered in various ways, e.g., as a transdermal patch, as a spot-on or as an ointment.

5

It is especially advantageous to formulate the aforementioned pharmaceutical compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used in the specification and claims herein refers to physically discrete units suitable as unitary dosages, each unit containing a predetermined quantity of active ingredient calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. Examples of such dosage unit forms are tablets (including scored or coated tablets), capsules, pills, powder packets, wafers, injectable solutions or suspensions, teaspoonfuls, tablespoonfuls and the like, and segregated multiples thereof.

### Compound identification

The compounds were identified by LC/MS using a gradient elution system on a reversed phase HPLC. The compounds are identified by their specific retention time and their protonated molecular ion  $MH^+$  peak. The HPLC gradient was supplied by a Waters Alliance HT 2790 system with a column heater set at 40°C. Flow from the column was split to a Waters 996 photodiode array (PDA) detector and a Waters-Micromass ZQ mass spectrometer with an electrospray ionization source operated in positive and negative ionization mode. Reversed phase HPLC was carried out on a Xterra MS C18 column (3.5  $\mu m$ , 4.6 x 100 mm) with a flow rate of 1.6 ml/min. Three mobile phases (mobile phase A 95% 25mM ammoniumacetate + 5% acetonitrile; mobile phase B: acetonitrile; mobile phase C: methanol) were employed to run a gradient condition from 100 % A to 50% B and 50% C in 6.5 minutes, to 100 % B in 1 minute, 100% B for 1 minute and reequilibrate with 100 % A for 1.5 minutes. An injection volume of 10  $\mu L$  was used.

Mass spectra were acquired by scanning from 100 to 1000 in 1 s using a dwell time of 0.1 s. The capillary needle voltage was 3kV and the source temperature was maintained at 140°C. Nitrogen was used as the nebulizer gas. Cone voltage was 10 V for positive ionization mode and 20 V for negative ionization mode. Data acquisition was performed with a Waters-Micromass MassLynx-Openlynx data system.

of the substrate is subsequently measured as light energy emitted using a streptavidin-  
coated Flash Plate (PerkinElmer Life Sciences) by trapping and quantifying the binding  
of the biotin tagged and radiolabeled substrate.

*Detailed description*

The EGFR kinase reaction is performed at 30°C for 60 minutes in a 96-well microtiter  
FlashPlate (PerkinElmer Life Sciences). For each of the tested compounds a full dose  
response  $1.10^{-6}$ M to  $1.10^{-10}$ M has been performed. IRESSA<sup>®</sup> and Tarceva<sup>™</sup> (erlotinib)  
15 were used as reference compounds. The 100 µl reaction volume contains 54.5 mM  
TrisHCl pH 8.0, 10 mM MgCl<sub>2</sub>, 100µM Na<sub>3</sub>VO<sub>4</sub>, 5.0 µM unlabeled ATP, 1mM DTT,  
0.009% BSA, 0.8 µCi AT<sup>33</sup>P, 0.35 µg/well poly(GT)biotin and 0.5 µg EGFR-kinase  
domain/well.

20 The reaction is stopped by aspirating the reaction mixture and washing the plate 3x  
with 200 µl wash/stop buffer (PBS + 100 mM EDTA). After the final wash step 200 µl  
of wash/stop buffer was added to each well and the amount of phosphorylated (<sup>33</sup>P)  
Poly(GT)biotin determined by counting (30 sec/well) in a microtiterplate scintillation  
counter.

25 In the glass-fiber filter technology EGFR kinase reaction assay, a kinase substrate  
consisting of poly(L-glutamic acid-L-tyrosine) (poly(GT)), is incubated with the  
aforementioned protein in the presence of (<sup>33</sup>P) radiolabeled ATP. (<sup>33</sup>P) Phosphorylation  
of the substrate is subsequently measured as radioactivity bound on a glassfiber-filter.

*Detailed description*

The EGFR kinase reaction is performed at 25°C for 10 minutes in a 96-well microtiterplate. For each of the tested compounds a full dose response  $1.10^{-6}$ M to  $1.10^{-10}$ M has been performed. IRESSA® and Tarceva™ (erlotinib) were used as reference compounds. The 25 µl reaction volume contains 60 mM TrisHCl pH 7.5, 3 mM MgCl<sub>2</sub>, 3 mM Mn Cl<sub>2</sub>, 3 µM Na<sub>3</sub>VO<sub>4</sub>, 50 µg/ml PEG20000, 5.0 µM unlabeled ATP, 1mM DTT, 0.1 µCi AT<sup>33</sup>P, 62.5 ng/well poly(GT) and 0.5 µg EGFR-kinase domain/well.

The reaction is stopped by adding 5 µl of a 3% phosphoric acid solution. 10 µl of the reaction mixture is then spotted onto a Filtermat A filter (Wallac) and washed 3 times for 5 min. in 75 mM phosphoric acid and 1 time for 5 min. in methanol prior to drying and quantification on the Typhoon (Amersham) using a LE phosphorage storage screen.

Example C.2: Serum starved proliferation assay on the ovarian carcinoma SKOV3 cells

The ovarian carcinoma cell line (SKOV3) was used in an epidermal growth factor stimulated cell proliferation assay, to assess the inhibitory effect of the compounds on EGF in whole cells.

In a first step the SKOV3 cells were incubated for 24 hours in the presence of 10% FCS serum. In the second step the cells were incubated with the compounds to be tested in a serum free condition (37 °C and 5% (v/v) CO<sub>2</sub>) and subsequently stimulated for 72 hours with EGF at a final concentration of 100 ng/ml. The effect of the compounds on the EGF stimulation was finally assessed in a standard MTT cell viability assay.

The following table provides the pIC50 values of the compounds according to the invention, obtained using the above mentioned kinase assays.

Compound number	In vitro kinase activity assay (C1) : IC50 in nM	SKOV3 cell (C2) : IC50 in µM

#### D. Composition examples

The following formulations exemplify typical pharmaceutical compositions suitable for systemic administration to animal and human subjects in accordance with the present invention.

- 5 "Active ingredient" (A.I.) as used throughout these examples relates to a compound of formula (I), (XXXI) or a pharmaceutically acceptable addition salt thereof.

#### Example D.1 : film-coated tablets

##### Preparation of tablet core

- 10 A mixture of A.I. (100 g), lactose (570 g) and starch (200 g) was mixed well and thereafter humidified with a solution of sodium dodecyl sulfate (5 g) and polyvinyl-pyrrolidone (10 g) in about 200 ml of water. The wet powder mixture was sieved, dried and sieved again. Then there was added microcrystalline cellulose (100 g) and hydrogenated vegetable oil (15 g). The whole was mixed well and compressed into tablets, giving 10.000 tablets, each comprising 10 mg of the active ingredient.

##### Coating

- 15 To a solution of methyl cellulose (10 g) in denaturated ethanol (75 ml) there was added a solution of ethyl cellulose (5 g) in CH<sub>2</sub>Cl<sub>2</sub> (150 ml). Then there were added CH<sub>2</sub>Cl<sub>2</sub> (75 ml) and 1,2,3-propanetriol (2.5 ml). Polyethylene glycol (10 g) was molten and dissolved in dichloromethane (75 ml). The latter solution was added to the former and then there were  
20 added magnesium octadecanoate (2.5 g), polyvinyl-pyrrolidone (5 g) and concentrated color suspension (30 ml) and the whole was homogenated. The tablet cores were coated with the thus obtained mixture in a coating apparatus.
